

HW 6

Group: **Holli, Liam, Kseniia**

As a group, the focus of the research would be looking at the different types of health expenditures and outcomes with the different economic indicators that may affect healthcare. Based on the healthcare approach, wanted to focus on New York City and how the system is structured covering a big city. In addition, looking at how accessible healthcare is to people in the city. There are different scenarios of people who receive healthcare from a private employer paying out of pocket to a vendor, etc. Plus, based on the cost of the healthcare plan, are there family members that are part of the person's plan that he or she needs to support? How is the cost distributed among the operation of the healthcare-specific to just New York State and/or to the rest of the country? But does it affect someone who works in New York City but lives in New Jersey or lives in New York City and works in New Jersey? There are a few factors to look at that can affect the economic analysis of the cost of the healthcare system specifically in New York City (or the state).
